

Interesting Virus Theory

This was prepared by me, Roger Golden Brown, and can be found [here](#), along with lots of material related to the ongoing Global Coup [here on my website](#).

Published November 19, 2021, Updated February 3, 2024

I present this because it's important to question the "settled science" of virology. However this person came up with their idea of what a virus is, whether by research, epiphany, or in some other way, it is interesting, although they seem to be talking about two different things; first, a natural cellular phenomenon and then a manufactured toxin.

This is from a BitChute commenter (Kind After Kind), commenting on Really Graceful's BitChute video about Jen Psaki: [*The White House Says You Can't Post That, Delete It Lol*](#)

Kind After Kind Virus Theory

You can't kill a virus because it isn't a living thing. It's a solvent within the cell that protects it from invasion. It's actually our friend unless we have weak immune systems or take the yearly flu shot. Old people fall for it every year. However, our bodies are so contaminated that the viral soap is overwhelmed and can make us feel sick in an urgent attempt to clean our bodies. Some people will get flu symptoms every year while others every few years. And some never get the flu.

A virus inside the body tries to sync up with others around us. Much like women whose periods will sync up after long exposure to each other. Flu viruses work the same way, that's why we think it's contagious when it's actually triggering other bodies around us to clean our cells. Unfortunately the ones who are the weakest feel the misery of this process while others may feel nothing at all. Feeling nothing during this process indicates a nice healthy body. The only way to get a flu virus is through injection. That's why I stay away from flu shots. Every Virologist in the world knows this and some have died trying to tell us this information. In ancient times these so called viruses were unheard of. The majority of these infectious diseases are made in a lab and not by nature. They call them viruses but we know they modify bacteria to do anything they want.. and call it anything they want.

The Bubonic Plague was the first experimental bio-warfare, then the measles, chicken pox, small pox, mumps, rubella, yellow fever, Malaria, polio...the list just goes on and on. They call every one of these diseases viruses and make us believe it's natural. Side effects of manufactured diseases: Shingles, Allergies, Autism and a thousand other side effects.
